Purification and characterization of secretory phospholipase B,
"Purification and lysophospholipase/transacylase from a virulent
strain of the pathogenic fungus Cryptococcus neoformans.";
Biochem. J. 347:431-439(2000)
-!- FUNCTION: A NOVEL FUNGAL PROTEIN THAT EXHIBITS PHOSPHOLIPASE B
-!- FUNCTION: LYSOPHOSPHOLIPASE (LPL) AND LYSOPHOSPHOLIPASE JAC.
-!- CATIVITIES. ACTIVE ONLY AT ACIDIC PH.
-!- CATIVITIES. ACTIVE AT A ACIDIC PH.
-!- CATIVITIES. ACTIVE A ACIDIC PH.
-!- GATALYTIC ACTIVITY: 2-lysophosphatidylcholine + H(2)O =
-!- Glycerophosphocholine + a fatty acid anion.
-!- ENZYME REGULATION: INHIBITED BY FERRIC ION.
                                                    30-WAY-2000 (Rel. 39, Last sequence update)
16-OCT-2001 (Rel. 40, Last annotation update)
Extracellular phospholipase (RC 3.1.1.5) (Fragments).
Cryptococcus neoformans (Filobasidiella neoformans)
Eukaryota; Fungi; Basidiomycota; Hymenomycetes; Heterobasidiomycetes;
Tremellomycetidae; Tremellales; Tremellaceae; Filobasidiella.

Nature 407:757-762(2000).

-!- FUNCTION: Carrier of the growing fatty acid chain in fatty acid
biosynthesis (By similarity).

-!- PATHWAY: De novo fatty acid biosynthesis.

-!- PATHWAY: The propentetheline is transferred from CoA to a specific serie of the apo-ACP-like protein (Potential).

-!- SIMILARITY: Contains 1 acyl carrier domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                           Proc. Natl. Acad. Sci. U.S.A. 96:10248-10253(1999).

-!- FUNCTION: This b-type cytochrome is tightly associated with the reaction center of photosystem II and possibly is part of the water-oxidation complex.

-!- SUBUNIT: Heterodimer of an alpha subunit and a beta subunit.
-!- SIMILARITY: Belongs to the psbE / psbF family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE=97257506; PubMed=9103980;

in nucleosome formation.
SUBUNIT: The nucleosome is an octamer containing two molecules
each of H2A, H2B, H3 and H4. The octamer wraps approximately 146
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chromosomal protein; Nucleosome core; Nuclear protein; DNA-binding. -!- FUNCTION: THIS PROTEIN IS ONE OF THE NUCLEAR-CODED POLYPEPTIDE
CHAINS OF CYTOCHROME C OXIDASE, THE TERMINAL OXIDASE IN
MITOCHONDIAILA ELECTRON TRANSPORT. THIS PROTEIN MAY BE ONE OF THE
HEME-BINDING SUBUNITS OF THE OXIDASE.
-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Biol. Chem. 276:19363-19374(2001).
-!- SIBUNIT: Component of the mitochondrial ribosome small subunit (28S) which comprises a 12S rRNA and about 30 distinct proteins.
-!- SUBCELLULAR LOCATION: Mitochondrial.
-!- SIMILARITY: BELONGS TO THE S21P FAMILY OF RIBOSOMAL PROTEINS.

J. Biol. Chem. 274:8405-8410(1999)
Acid (LTA). Activated D-alanyl-Dcp donates its D-alanyl
Substituent to membrane-associated LTA (By similarity).
J. CATALYTIC ACTIVITY: ATP + D-alanyl-poly(ribitol phosphate) =
AMP + diphosphate + O-b-alanyl-poly(ribitol phosphate).
J. PATHWAY: D-alanyl-lipoteichoic acid biosynthesis.
J. PYM: 4. -phosphopantetheine is transferred from CoA to a specific serine of apo-DCP (By similarity).
J. SIMILARITY: Contains 1 acyl carrier domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Menome sequence of the endocellular bacterial symbiont of aphids
Buchnera sp. APS.";
Nature 407:181-86 (2000)
-!- FUNCTION: THIS PROTEIN BELONGS TO THE HISTONE LIKE FAMILY OF
PROKARYOTIC DNA-BINDING PROTEINS WHICH ARE CAPABLE OF WRAPPING
DNA TO STABILIZE IT, AND PREVENT ITS DENATURATION UNDER EXTREME
ENVIRONMENTAL CONDITIONS (BY similarity).
-!- SUBMUNT: Homodimer (By similarity).
-!- SIMILARITY: BELONGS TO THE BACTERIAL HISTONE-LIKE PROTEIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
